# Lecture 4

## Expert systems

**Dr. Fatma Eskander**  
**Math.department, Faculty of Science, Mansoura**  
**University**

# Knowledge Representation Techniques

# Knowledge Representation Techniques

---

## Common Techniques:

- 1- Productions (Rules)
- 2- Semantic Networks
- 3- Frames
- 4- Logic

# **Object-Attribute-Value Triple (O-A-V)**

---

**Definition:** A way to represent facts as three-part statements

**Format:** (Object, Attribute, Value)

- **Object:** The entity (e.g., My Car)
- **Attribute:** The property (e.g., Color)
- **Value:** The property's value (e.g., Red)

## **Examples:**

(Student, Age, 20)

(Apple, Taste, Sweet)

(House, Size, Large)

(Book, Author, "Shakespeare")

# 3- FRAMES

---

**Definition:** A data structure that represents a stereotypical object, event, or concept. It's like a form with pre-defined slots to be filled.

## Structure:

- Frame Name (concept)
- Slots (attributes)
- Fillers (values for attributes)
- Default values
- Procedures (methods)

In OAV terms, the car is the object, the slot name is the attribute, and the fillers is the value.

# 3- FRAMES

---

## Examples:

Slots	Fillers
manufacturer	General Motors
model	Chevrolet Caprice
year	1979
transmission	automatic
engine	gasoline
tires	4
color	blue

# 3- FRAMES

---

## Examples:

Frame: PERSON

- Name: [John Smith]
- Age: [30]
- Occupation: [Engineer]
- Address: [123 Main St]
- Default Height: [170 cm]

Frame: CAR

- Make: [Toyota]
- Model: [Camry]
- Year: [2020]
- Color: [Blue]
- Has: [4 wheels]
- Can: [Drive, Transport]

Semantic nets provide 2-dimensional knowledge (node-link); frames provide 3-dimensional knowledge (object-attribute-value).

## 4- Logic and Sets

---

**Logic:** A formal system for reasoning and deriving conclusions

**Sets:** Collections of distinct objects

### **Purpose in Knowledge Representation:**

- Provide unambiguous representation
- Enable automated reasoning
- Support mathematical proof of conclusions

**Applications:** Expert systems, theorem proving, database queries

# 4- Logic and Sets

---

## Forms of Logic

**A-Propositional Logic:** Deals with simple propositions (statements that are true or false) and their connectives (AND, OR, NOT, etc.).

**B- Predicate Logic (First-Order Logic):** More powerful. Deals with predicates (properties of objects) and quantifiers ( $\forall$  "for all",  $\exists$  "there exists").

## 4- Logic and Sets

---

### Venn Diagrams

Visual representations of logical relationships between sets using overlapping circles.

#### Uses:

Show intersections between sets

Illustrate logical operations (union, intersection, complement)

Visualize categorical relationships

## 4- Logic and Sets

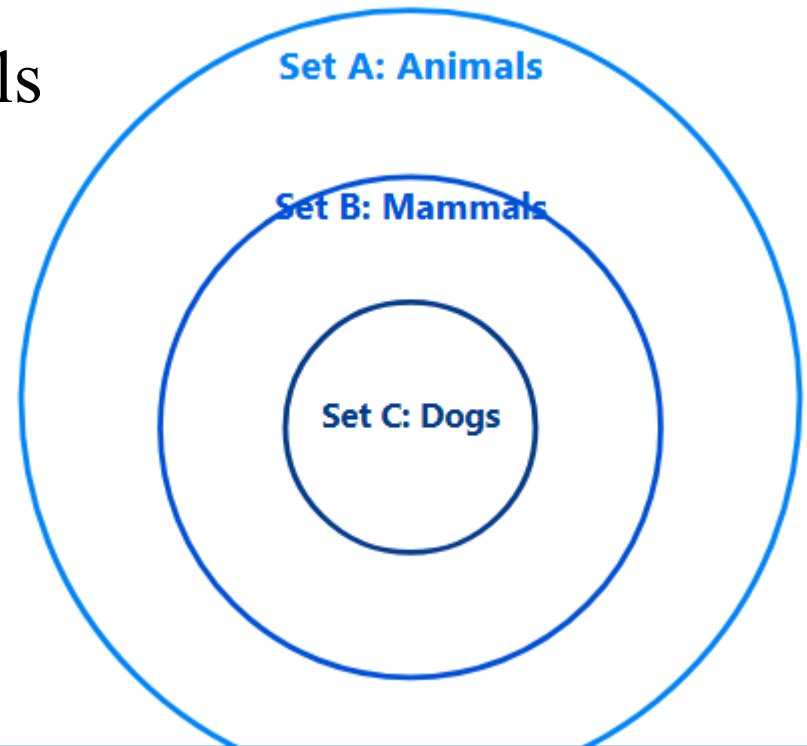

---

- **Set A (Animals)** - The largest blue circle containing all animals

- **Set B (Mammals)** - A medium circle inside Animals, showing mammals are a subset of animals

- **Set C (Dogs)** - The smallest circle inside Mammals, showing dogs are a subset of mammals

**Venn Diagram Example**

**Subset Relationships:**

$C \subset B \subset A$  (Dogs are subset of Mammals, Mammals are subset of Animals)

# 4- Logic and Sets

---

## A-Propositional Logic:

A formal system dealing with propositions and their relationships

**Propositions:** Statements that are either TRUE or FALSE

### Examples of Propositions:

P: "It is raining" (True or False)

Q: "The ground is wet" (True or False)

R: "I will use an umbrella" (True or False)

# Propositional Logic

---

## A-Propositional Logic:

### Logical Connectives:

- AND ( $\wedge$ ):  $P \wedge Q$
- OR ( $\vee$ ):  $P \vee Q$
- NOT ( $\neg$ ):  $\neg P$
- IMPLIES ( $\rightarrow$ ):  $P \rightarrow Q$
- IF AND ONLY IF ( $\leftrightarrow$ ):  $P \leftrightarrow Q$

# Truth Tables

---

**Definition:** Tables showing all possible truth values for logical expressions

**AND ( $\wedge$ ) Truth Table:**

<b>P</b>	<b>Q</b>	<b><math>P \wedge Q</math></b>
----------	----------	--------------------------------

<b>T</b>	<b>T</b>	<b>T</b>
----------	----------	----------

<b>T</b>	<b>F</b>	<b>F</b>
----------	----------	----------

<b>F</b>	<b>T</b>	<b>F</b>
----------	----------	----------

<b>F</b>	<b>F</b>	<b>F</b>
----------	----------	----------

# Truth Tables

---

**OR ( $\vee$ ) Truth Table:**

<b>P</b>	<b>Q</b>	<b><math>P \vee Q</math></b>
----------	----------	------------------------------

<b>T</b>	<b>T</b>	<b>T</b>
----------	----------	----------

<b>T</b>	<b>F</b>	<b>T</b>
----------	----------	----------

<b>F</b>	<b>T</b>	<b>T</b>
----------	----------	----------

<b>F</b>	<b>F</b>	<b>F</b>
----------	----------	----------

**NOT ( $\neg$ ) Truth Table:**

<b>P</b>	<b><math>\neg P</math></b>
----------	----------------------------

<b>T</b>	<b>F</b>
----------	----------

<b>F</b>	<b>T</b>
----------	----------

# Truth Tables

---

## IMPLIES ( $\rightarrow$ ) Truth Table:

P	Q	$P \rightarrow Q$
---	---	-------------------

T	T	T
---	---	---

T	F	F
---	---	---

F	T	T
---	---	---

F	F	T
---	---	---

**Note:** Implication is only false when P is true and Q is false

# Knowledge vs. Expert Systems

---

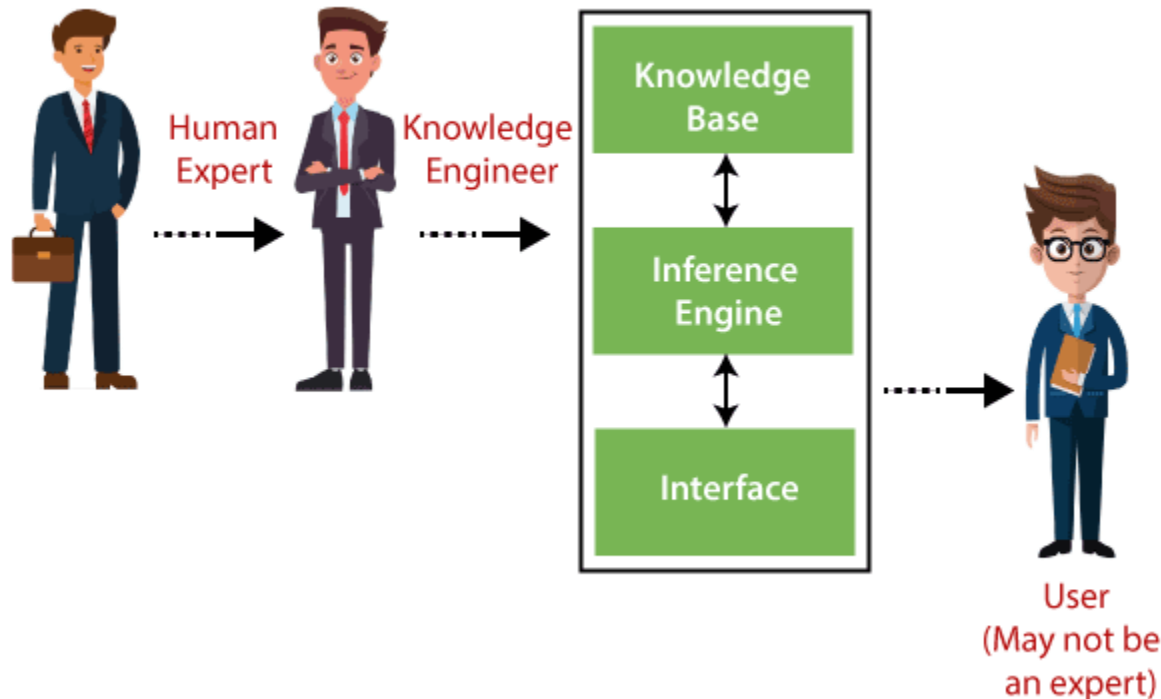

Knowledge representation is key to the success of expert systems.

Expert systems are designed for knowledge representation based on rules of logic called inferences.

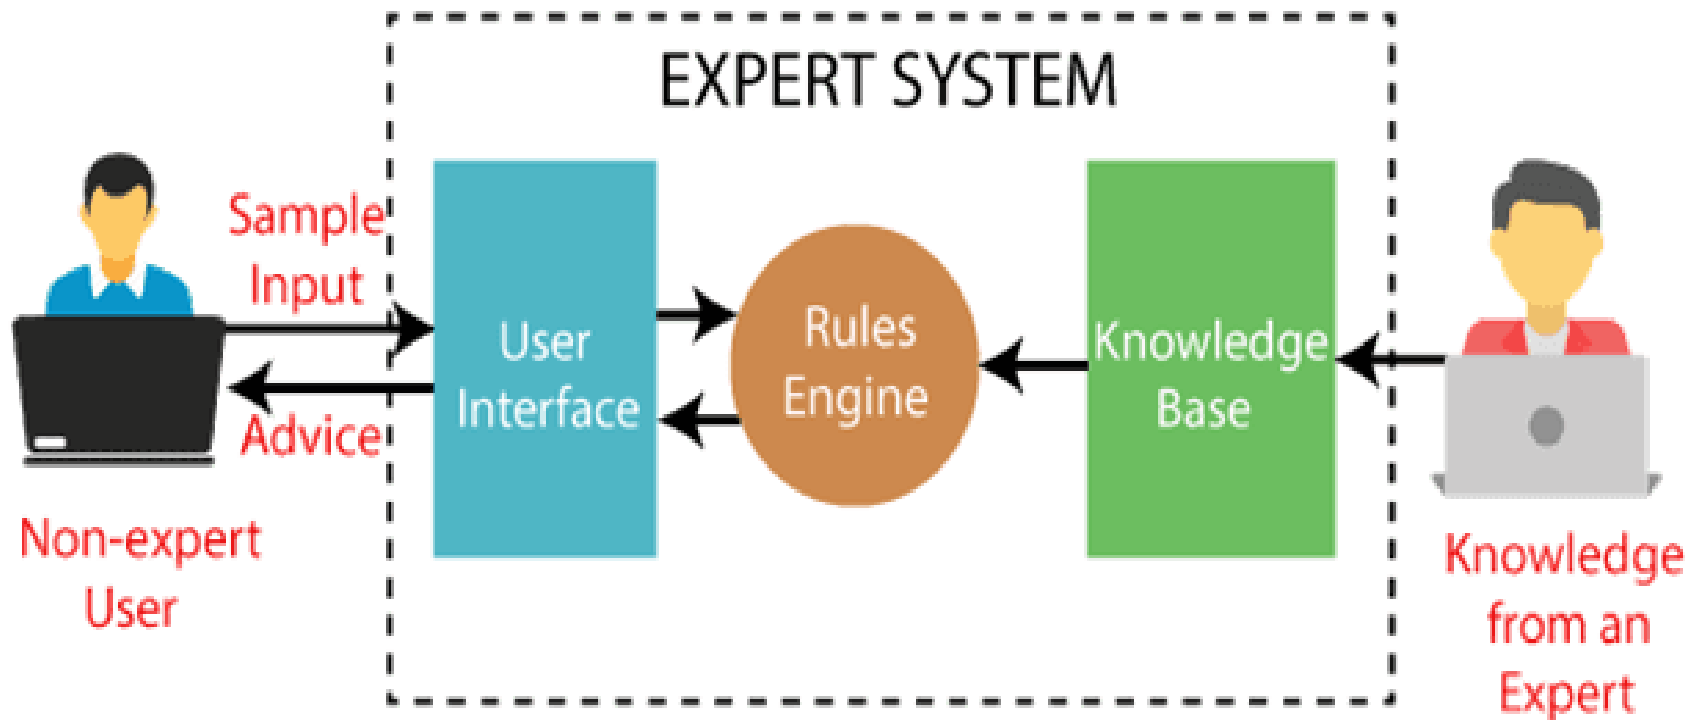

## KEY DIFFERENCES

Aspect	Knowledge	Expert Systems
Definition	Information, understanding, and skills acquired through experience or education	Computer programs that use knowledge to solve problems like human experts

Aspect	Knowledge	Expert Systems
<b>Storage</b>	Human brain, documents, databases	Computer knowledge base
<b>Scope</b>	Broad, general	Narrow, specialized
<b>Application</b>	Any situation	Specific domain problems

# Methods of Inference

# Foundational Structures

---

## What is a Graph?

- **Definition:** A graph  $G = (V, E)$  is a mathematical structure consisting of:
  - **V (Nodes):** A set of entities.
  - **E (Edges):** A set of connections between pairs of vertices.
- **Visual:** A simple diagram with circles (nodes) and connecting lines (edges).

# Foundational Structures

---

## Features of graph

### 1. Path

A **path** is a sequence of edges that connects a sequence of distinct **nodes**.

**A- Simple Path:** No repeated nodes

Example:  $A \rightarrow B \rightarrow C \rightarrow D$

# Foundational Structures

---

## Features of graph

**B-Non-simple Path:** Has repeated nodes.

Example:  $A \rightarrow B \rightarrow C \rightarrow B \rightarrow D$

# Foundational Structures

---

## Features of graph

### 2. Circuit (Cycle)

A path that starts and ends at the same node.

**A- Simple Circuit:** Visits each node exactly once before returning to start.

Example:  $A \rightarrow B \rightarrow C \rightarrow D \rightarrow A$

# Foundational Structures

---

## 2. Circuit (Cycle)

### B- Eulerian Circuit

Visits every edge exactly once and starts and ends at the same node.

A graph has an Eulerian circuit if and only if all of its nodes have an **even degree**.

**Node Degrees (Number of edges connected to each node)**

# Foundational Structures

---

## B- Eulerian Circuit

**Ex (1):**

**Degree Analysis:**

**A:** Connected to B, D, C  $\rightarrow$  **Degree = 3 (odd)**

**B:** Connected to A, C  $\rightarrow$  **Degree = 2 (even)**

**C:** Connected to B, D, A  $\rightarrow$  **Degree = 3 (odd)**

**D:** Connected to C, A  $\rightarrow$  **Degree = 2 (even)**

**✗ This graph has NO Eulerian circuit** because nodes A and C have odd degrees.

# Foundational Structures

---

## B- Eulerian Circuit

**Ex (2):**

**A:** Connected to B, C  $\rightarrow$  **Degree = 2** (even)

**B:** Connected to A, C  $\rightarrow$  **Degree = 2** (even)

**C:** Connected to A, B  $\rightarrow$  **Degree = 2** (even)

✓ **Eulerian Circuit:**  $A \rightarrow B \rightarrow C \rightarrow A$

All vertices have even degree ✓

Uses every edge exactly once ✓

Returns to starting vertex ✓

# Foundational Structures

---

## C- Hamiltonian Circuit

Visits every nodes exactly once

### Hamiltonian Circuit Conditions:

- Visits every node exactly once
- Returns to starting node
- No noderepetitions (except start/end)
- Graph must have at least 3 node

# Foundational Structures

## C- Hamiltonian Circuit

Ex (1):

# Foundational Structures

---

## 3. Connected Graph

A graph where there is a path between every pair of nodes.

**Example (Connected):**

**Example (Disconnected):**

# Foundational Structures

---

## 3. Connected Graph

(a) A nonconnected graph

(b) A connected graph

# Trees

---

- **Trees:** A Special Kind of Graph.

- **Definition:** A tree is a connected, acyclic graph.

**Acyclic:** Contains no cycles (no loop you can traverse and return to the start).

# Trees

---

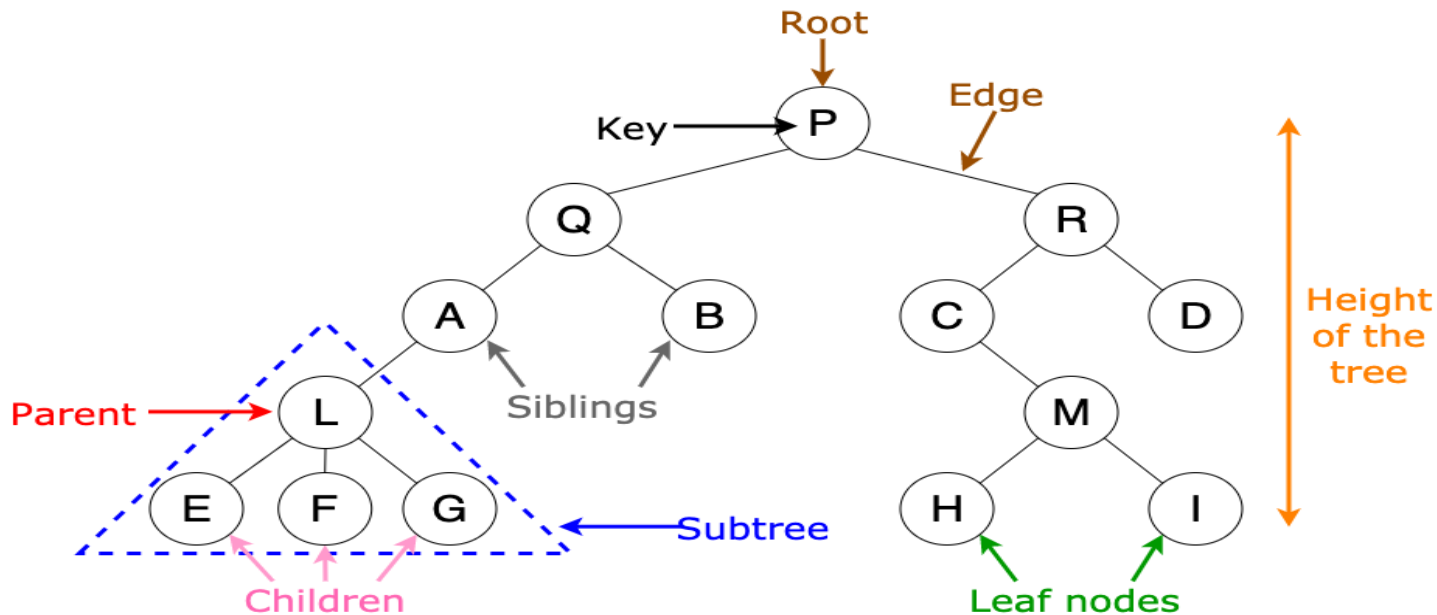

**Connected:** There is a path between any two nodes.

## Key Components:

**Root Node:** The topmost node.

**Parent/Child Nodes:** Hierarchical relationships.

**Leaf Nodes:** Nodes with no children.

# Trees

---

## Features

Every node, except the root, has exactly one parent.

Every node may give rise to zero or more child nodes.

A **binary tree** restricts the number of children per node to a maximum of two.

Degenerate trees have only a single pathway from root to its one leaf.

# Trees

---

## Example for Binary Tree
